

Cosmic Microwave Background, Part II: Theory

Instituto de
Física
Teórica
UAM-CSIC

Savvas Nesseris

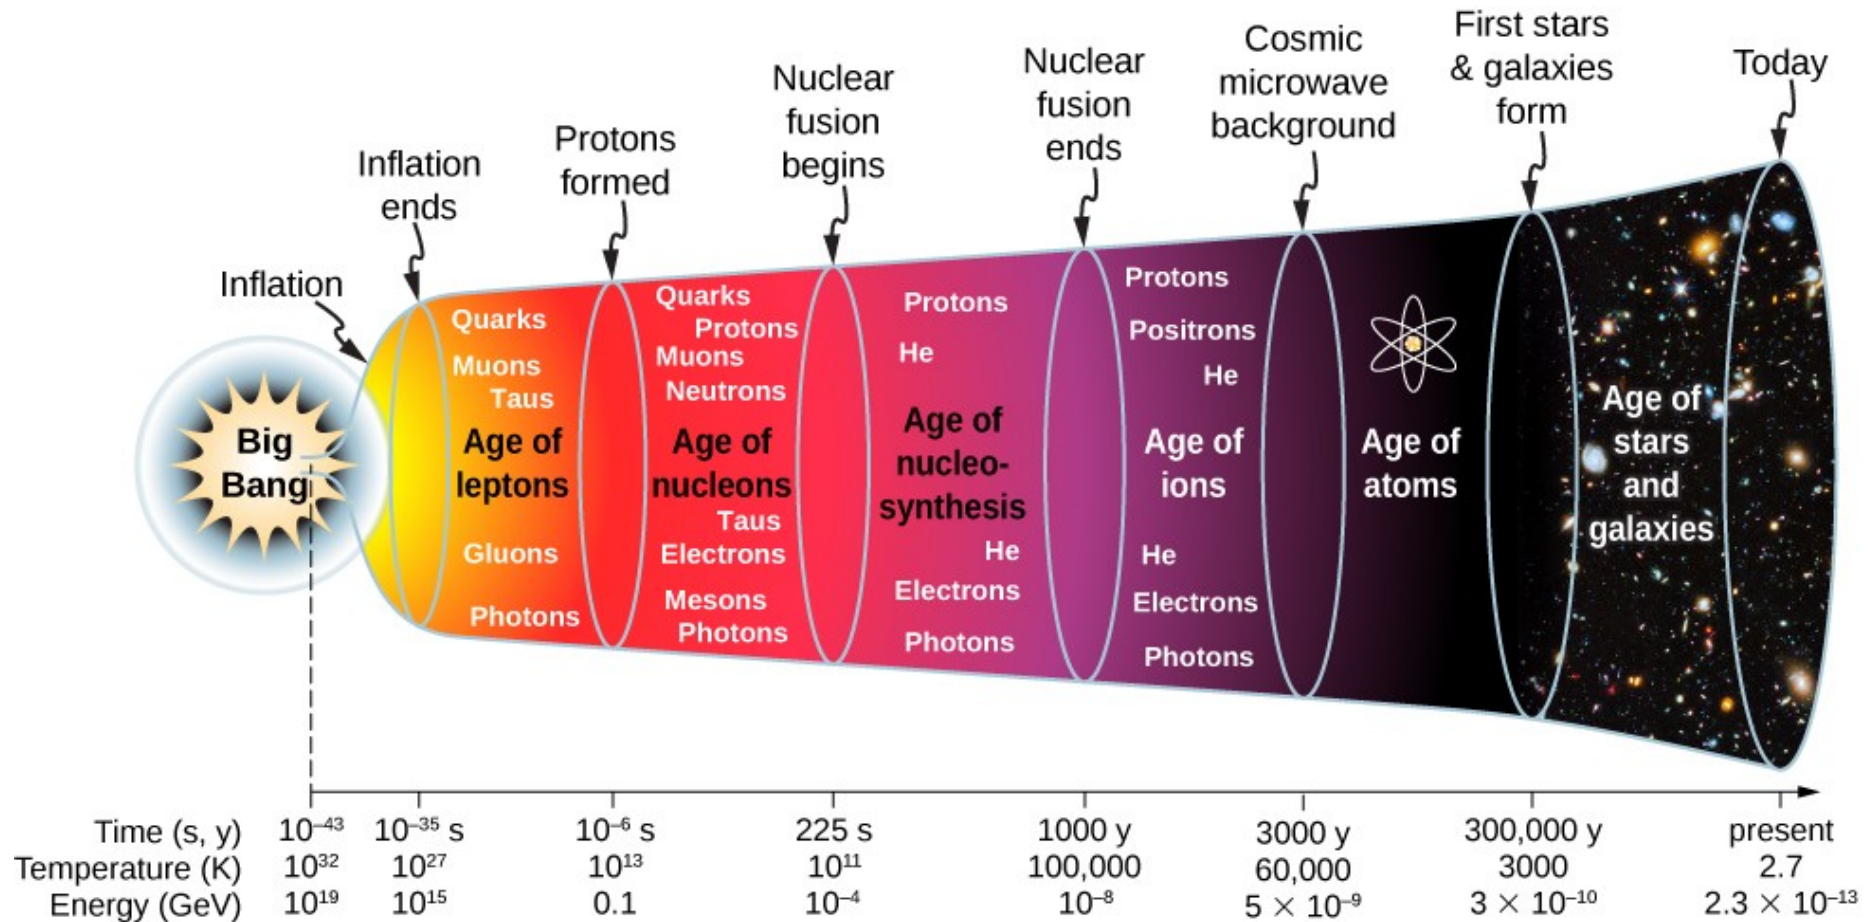

IFT/UAM-CSIC, Madrid, Spain

Main points of the lecture

- Overview (theory and basic framework)
- CMB features (effects, parameter sensitivity)
- BAO oscillations (rigorous proof, math codes, $P(k)$ behaviour)
- The Cls (SW and ISW), Planck papers, CLASS
- Summary

The hot Big Bang theory redux

The hot Big Bang theory redux

1) The Cosmic Microwave Background (CMB) is a relic of the hot Big Bang!

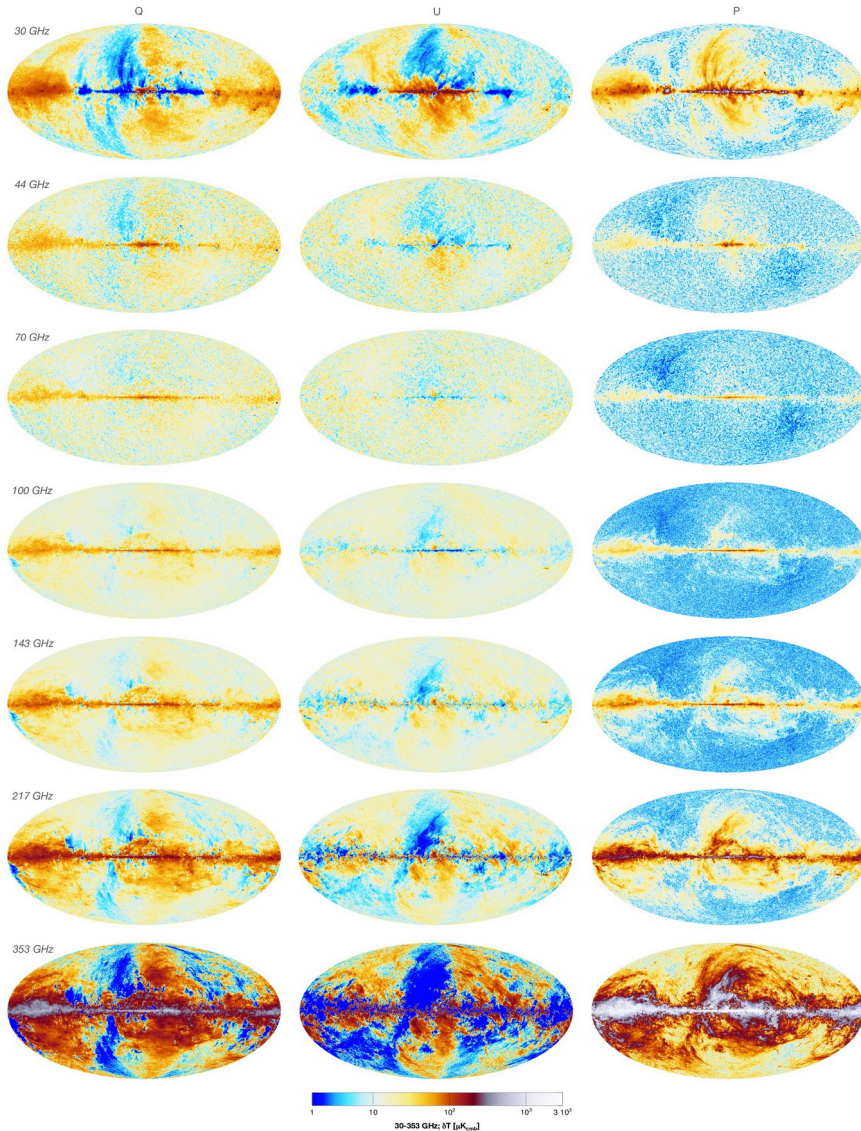

CMB anisotropies and spectrum

2) The CMB is an almost perfect black-body! Note: these are 400σ errors...

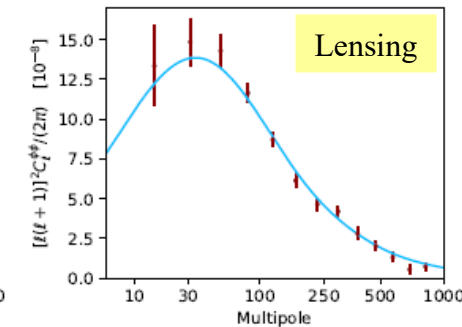

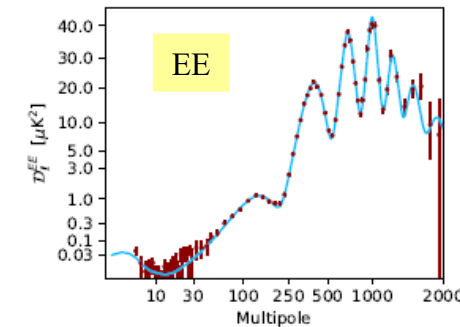

CMB anisotropies and spectrum

3) Planck 2018 CMB maps and power spectrum (1807.06205):

Healpix

CMB anisotropies and spectrum

4) Why all these frequencies (different channels)? The channels can be used to eliminate (subtract out) the Galactic noise!

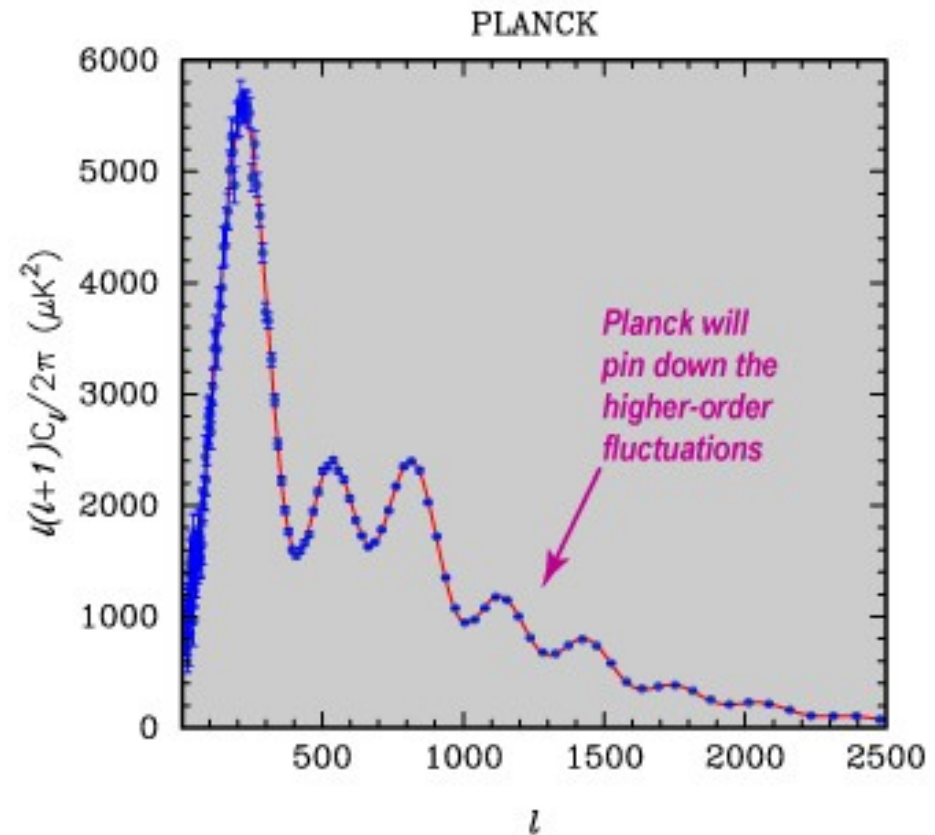

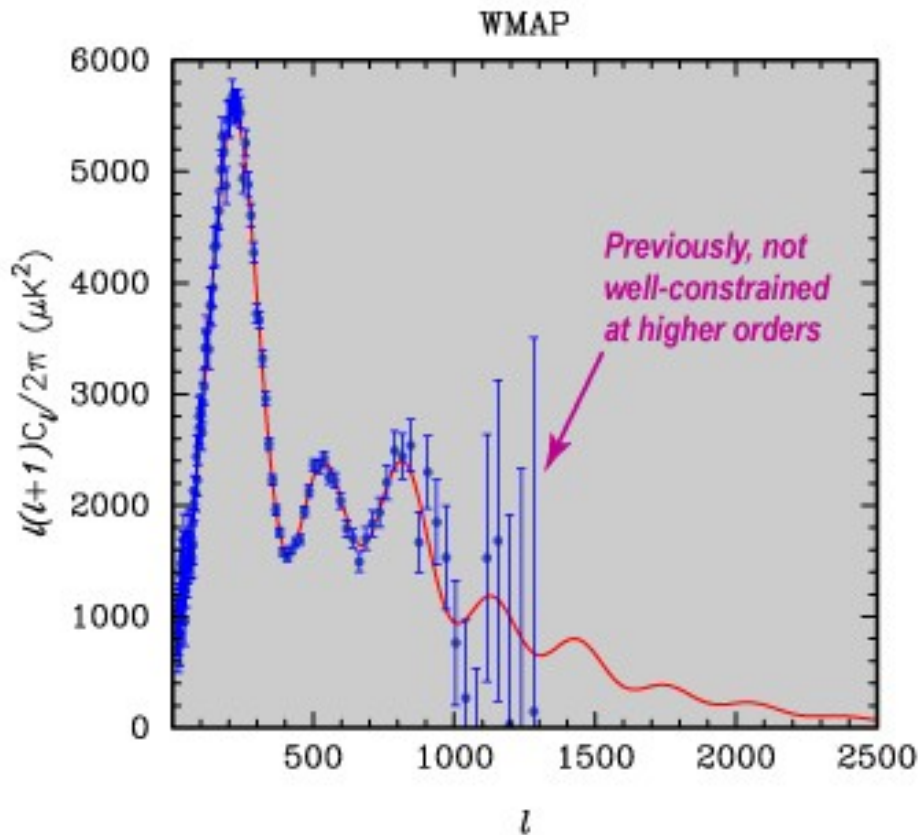

<http://planck.caltech.edu>

CMB anisotropies and spectrum

5) The extra channels also increase resolution, which means we can go to higher multipoles!

<http://planck.caltech.edu>

The CMB power spectrum

1) TT fluctuations, expand on Legendre polynomials and spherical harmonics

$\Delta \equiv \Delta T/T$ ← Temperature anisotropy = the CMB maps!

$$\Delta(\vec{x}, \hat{n}, \tau) = \int d^3k e^{i\vec{k}\cdot\vec{x}} \Delta(\vec{k}, \hat{n}, \tau) \equiv \int d^3k e^{i\vec{k}\cdot\vec{x}} \sum_{l=0}^{\infty} (-i)^l (2l+1) \Delta_l(\vec{k}, \tau) P_l(\hat{k} \cdot \hat{n})$$

$$\Delta(\hat{n}) = \sum_{l=0}^{\infty} \sum_{m=-l}^l a_{lm} Y_{lm}(\hat{n}), \quad a_{lm} = (-i)^l 4\pi \int d^3k Y_{lm}^*(\hat{k}) \Delta_l(\vec{k}, \tau)$$

Legendre polynomials

Spherical harmonics

2) Properties of the Legendre polynomials

$$\int_{-1}^1 dx P_\ell(x) P_{\ell'}(x) = \delta_{\ell\ell'} \frac{2}{2\ell+1}$$

$$(\ell+1)P_{\ell+1}(x) = (2\ell+1)xP_\ell(x) - \ell P_{\ell-1}(x)$$

$$P_0(x) = 1$$

$$P_1(x) = x$$

$$P_2(x) = \frac{3x^2 - 1}{2}$$

$-1 \leq x \leq 1$

3) Properties of the Spherical harmonics

$$\int d\Omega Y_{\ell m}^*(\Omega) Y_{\ell' m'}(\Omega) = \delta_{\ell\ell'} \delta_{mm'} \implies P_\ell(\hat{x} \cdot \hat{x}') = \frac{4\pi}{2\ell+1} \sum_{m=-\ell}^{\ell} Y_{\ell m}(\hat{x}) Y_{\ell m}^*(\hat{x}')$$

$$Y_{0,0}(\theta, \phi) = \frac{1}{\sqrt{4\pi}}$$

$$Y_{1,\pm 1}(\theta, \phi) = \mp i \sqrt{\frac{3}{8\pi}} \sin(\theta) e^{\pm i\phi}$$

The CMB power spectrum

4) Define two point correlation for the temperature anisotropy

$$C(\theta) \equiv \langle \Delta(\hat{n}_1) \Delta(\hat{n}_2) \rangle = \frac{1}{4\pi} \sum_{l=0}^{\infty} (2l+1) C_l P_l(\hat{n}_1 \cdot \hat{n}_2) \quad \longrightarrow \quad \langle a_{lm} a_{l'm'}^* \rangle = C_l \delta_{ll'} \delta_{mm'}$$

5) Consider initial perturbation

$$\Delta_l(\vec{k}, \tau) = \psi_i(\vec{k}) \Delta_l(k, \tau) \quad \longrightarrow \quad \langle \psi_i(\vec{k}_1) \psi_i(\vec{k}_2) \rangle = P_\psi(k) \delta_D(\vec{k}_1 + \vec{k}_2)$$

$$C_l = 4\pi \int d^3k P_\psi(k) \Delta_l^2(k, \tau)$$

6) The C_l s compress information! From $5 \cdot 10^7$ pX ($n_{\text{side}}=2048, n_{\text{pix}}=12 \cdot n_{\text{side}}^2$) to ~ 2500 multipoles

The CMB power spectrum

7) HEALPix (Hierarchical Equal Area isoLatitude Pixelisation). A 2-sphere is tessellated into curvilinear quadrilaterals with the lowest resolution 12 pixels and the resolution is increased by partitioning every pixel into 4 new.

$$N_{\text{side}} = 1, 2, 4, 8$$

Pixels are distributed on lines of constant latitude.

The sphere is partitioned, respectively, into 12, 48, 192, and 768 pixels.

Areas of all pixels at a given resolution are identical!

$$N_{\text{pix}} = 12 \times N_{\text{side}}^2 = 12, 48, 192, 768.$$

The CMB power spectrum

8) HEALPix converts CMB maps to Cls!

$$\hat{a}_{\ell m} = \frac{4\pi}{N_{\text{pix}}} \sum_{p=0}^{N_{\text{pix}}-1} Y_{\ell m}^*(\gamma_p) f(\gamma_p), \quad \longrightarrow \quad \hat{C}_\ell = \frac{1}{2\ell + 1} \sum_m |\hat{a}_{\ell m}|^2.$$

The CMB power spectrum

9) Polarization from Thomson scattering (E and B modes)

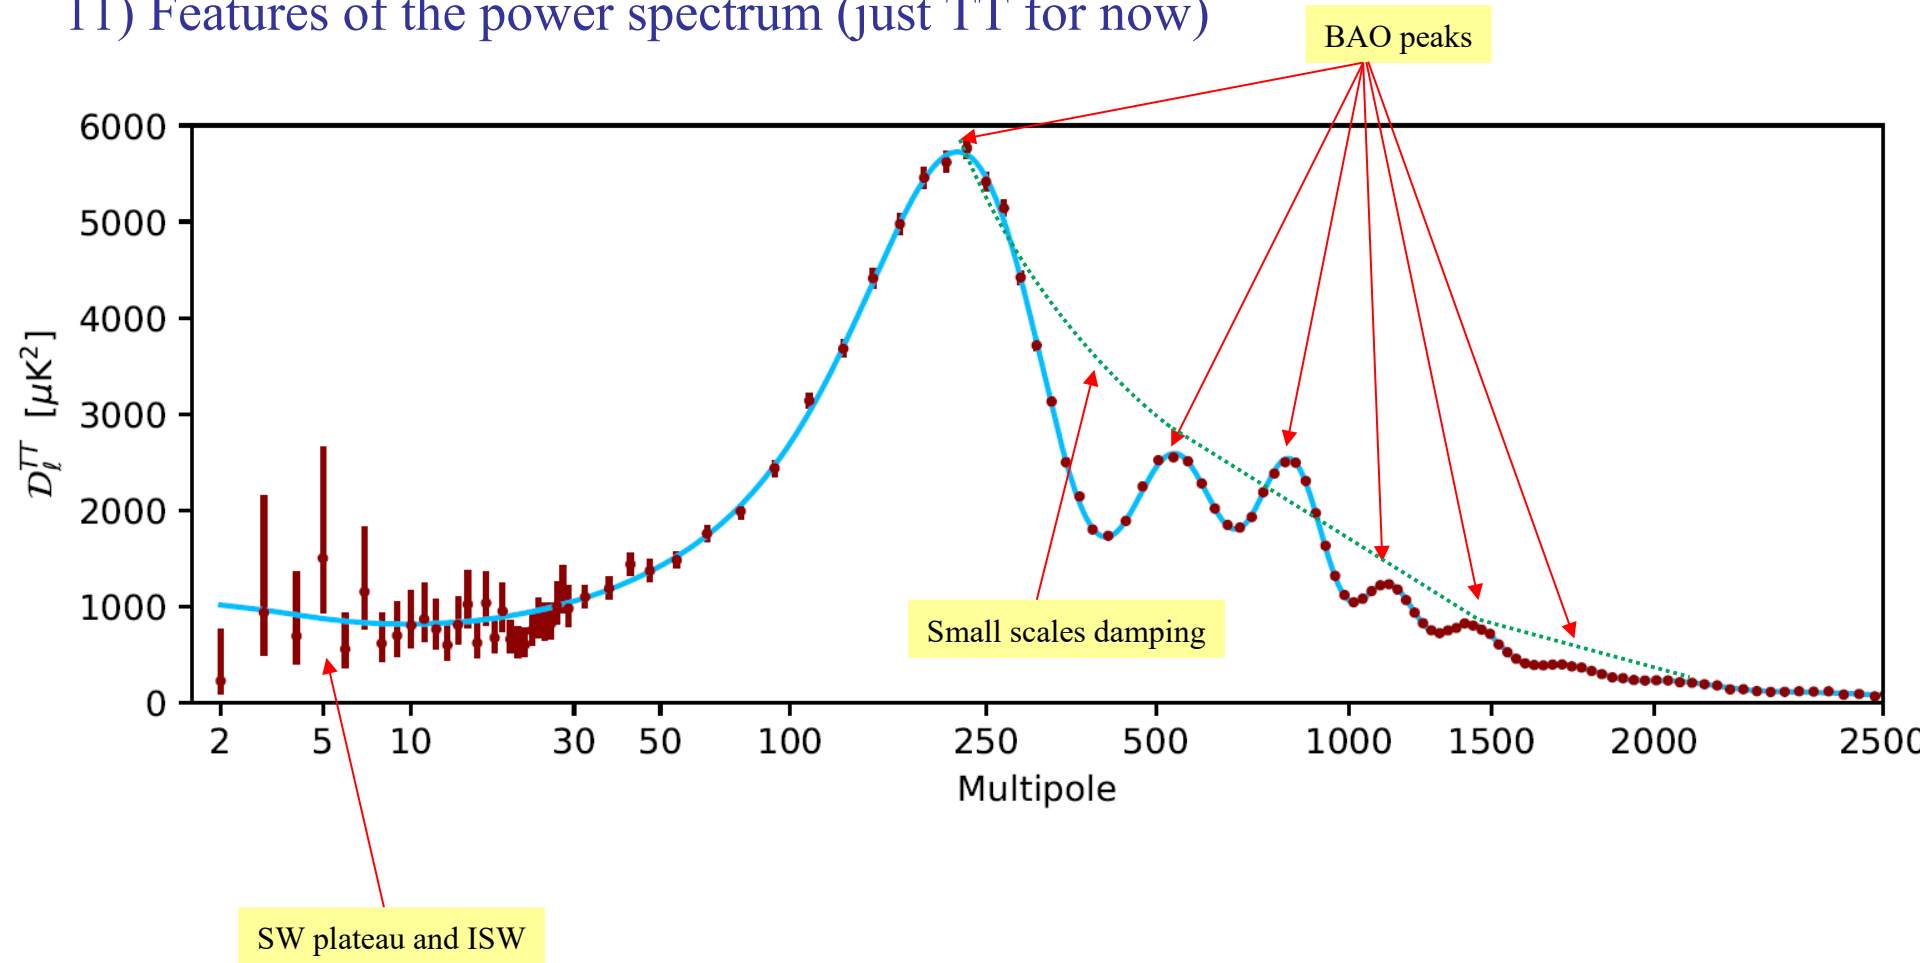

10) E mode is caused by thermal over/under-densities

B mode is caused by GWs and dust (due to magnetic fields & imperfect alignment)!

CMB anisotropies and spectrum

11) Features of the power spectrum (just TT for now)

Features of the TT CMB spectrum

1) Baryon Acoustic Oscillations

Peaks at specific multipoles due to competition between baryons and photons

2) Diffusion damping

Damping at small scales (large l) due to increase in mean free path of photons

3) Primary anisotropies

- i) Sachs-Wolfe effect (flat C_l s for $l < 30$)
- ii) Adiabatic/isocurvature perturbations
- iii) Doppler shift

4) Secondary anisotropies

- i) Integrated Sachs-Wolfe effect (enhances anisotropies at $l < 10$)
- ii) Reionization at $z \sim 10$

5) Cosmological parameters sensitivities

Features of CMB spectrum depend on parameters like Ω_m , Ω_b , Ω_{DE} , Ω_k , n_s etc

Baryon Acoustic Oscillations

1) Perturbation equations for Baryon-Photon plasma

$$\dot{\delta}_\gamma = -\frac{4}{3}\theta_\gamma + 4\dot{\phi},$$

$$\dot{\theta}_\gamma = k^2 \left(\frac{1}{4}\delta_\gamma - \sigma_\gamma \right) + k^2\psi + an_e\sigma_T(\theta_b - \theta_\gamma),$$

$$\dot{\theta}_b = -\theta_b + 3\dot{\phi},$$

$$\dot{\delta}_b = -\frac{\dot{a}}{a}\theta_b + c_s^2 k^2 \delta_b + \frac{4\bar{\rho}_\gamma}{3\bar{\rho}_b} an_e\sigma_T(\theta_\gamma - \theta_b) + k^2\psi$$

See Advanced Cosmo class
(CMB Module) next semester!

$$\delta \equiv \delta\rho/\bar{\rho}$$

$$\theta = ik^j v_j$$

BAO_calculations.nb

2) Define S as below and eliminate all except δ_γ :

$$\delta_\gamma - 4\phi \equiv 4S \quad \longrightarrow \quad \ddot{S} + \frac{\dot{R}}{1+R}\dot{S} + k^2 c_s^2 S = \left(-\frac{k^2}{3}\psi - \frac{k^2}{3}\phi/(1+R) \right)$$

Damping term

Oscillatory term

“Driving force”

Baryon Acoustic Oscillations

3) Zero order approximate solution (ignore damping and force):

$$\ddot{S} + k^2 c_s^2 S \simeq 0 \quad \longrightarrow \quad S = A \cos(kr_s + \theta_0)$$

$$c_s^2 = \frac{1}{3(1+R)}$$

Sound speed of baryon-photon plasma

$$R = \frac{3 \Omega_b}{4 \Omega_\gamma} = \frac{a^{-3}}{a^{-4}} R_0 = R_0 a$$

Sound horizon!

$$r_s = \int_0^\eta d\eta' c_s(\eta') \simeq c_s(\eta) \eta$$

4) Comparison and location of the peaks

$$k_p = \frac{n\pi}{r_s}$$

BAO.nb

Baryon Acoustic Oscillations

5) More accurate comparison (D is distance to recombination)

astro-ph/0006436

$$\ell_A \equiv \pi D / s_*$$

$$\ell_A \approx 172d \left(\frac{z_*}{10^3} \right)^{1/2} \times \left(\frac{1}{\sqrt{R_*}} \ln \frac{\sqrt{1+R_*} + \sqrt{R_* + r_* R_*}}{1 + \sqrt{r_* R_*}} \right)^{-1}$$

$$\ell_m = \ell_A (m - \phi)$$
$$\phi \approx 0.267 \left(\frac{r_*}{0.3} \right)^{0.1}$$

CAMB_plots.py

CMB_theory.nb

plot_cls.nb

Hot spots vs cold spots

1) Consider perturbed FRW metric with Newtonian potentials ϕ, ψ

astro-ph/9506072

$$ds^2 = a^2(\tau) \left\{ -(1 + 2\psi)d\tau^2 + (1 - 2\phi)dx^i dx_i \right\}$$

2) Photon four momentum, given the FRW metric:

$$P^\mu = (a^{-1}p(1 - \psi), a^{-1}p^i(1 + \phi)) \quad \longrightarrow \quad P^0 = a^{-1}p(1 - \psi) \sim \frac{1}{\lambda}$$

3) Einstein equations (0,0) and (i,j) parts give Poisson equations:

$$\begin{aligned} k^2 \phi &= -4\pi G_N a^2 \rho_m \delta_m \\ \phi &= \psi \end{aligned} \quad \longrightarrow \quad \psi = -4\pi G_N \frac{a^2}{k^2} \rho_m \delta_m$$

Hot spots vs cold spots

4) Definition of over-density

$$\delta_{\text{over}} \gg \delta_{\text{under}}$$

5) Given the above this translates to redshift for photon trying to escape

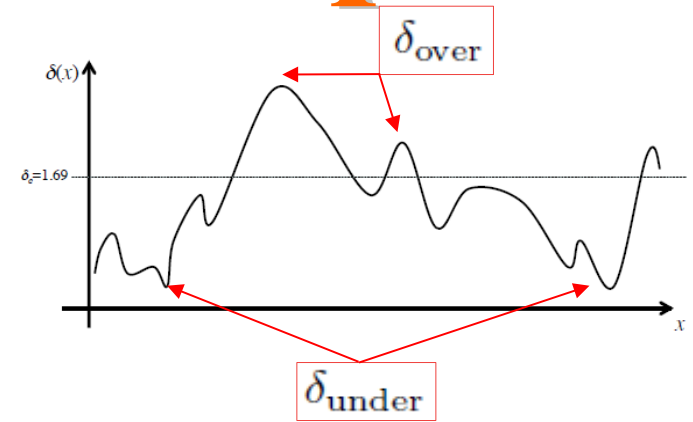

$$\delta_{\text{over}} > \delta_{\text{under}} \quad \Rightarrow \quad \psi_{\text{over}} < \psi_{\text{under}} \quad \Rightarrow$$

$$P_{\text{over}}^0 > P_{\text{under}}^0 \quad \Rightarrow \quad \lambda_{\text{over}} < \lambda_{\text{under}}$$

6) This leads to temperature decrease (coldspot) between overdensity and underdensity!

$$\frac{\Delta T}{T} \sim \frac{1}{3} \delta\psi \quad \Rightarrow \quad \frac{\Delta T}{T} < 0$$

$$\Delta T = T_{\text{over}} - T_{\text{under}} \quad \delta\psi = \psi_{\text{over}} - \psi_{\text{under}} < 0$$

Derivation of Sachs-Wolfe effect

- 1) SW effect → photon escapes static potential. To zero order the SW effect contribution is a Spherical Bessel (derive or see Dodelson 8.6)

SW_cls.nb

$$\Delta(\hat{n}, \tau_0) \approx \frac{1}{3} \psi(\vec{x} = -\vec{n}\chi, \tau_{\text{rec}}) \longrightarrow \Delta_l(k, \tau) = \frac{1}{3} j_l(k\chi).$$

- 2) Assume power-law power spectrum

$$P_\psi(k) = A\chi^3(k\chi)^{n-4} \propto k^{n-4} \longrightarrow C_l \approx \frac{2^n \pi^3}{9} A \frac{\Gamma(3-n) \Gamma\left(\frac{2l+n-1}{2}\right)}{\Gamma^2\left(\frac{4-n}{2}\right) \Gamma\left(\frac{2l+5-n}{2}\right)}$$

n=1

- 3) Be careful with notation

$$C_l \approx (8\pi^2/9)A/[l(l+1)]$$

$$C(\theta) = \left\langle \frac{\delta T^*}{T}(\mathbf{n}) \frac{\delta T}{T}(\mathbf{n}') \right\rangle_{\mathbf{n} \cdot \mathbf{n}' = \cos \theta} = \frac{1}{4\pi} \sum_{l=2}^{\infty} (2l+1) C_l P_l(\cos \theta)$$

$$\frac{\delta T}{T}(\theta, \phi) = \frac{1}{3} \Phi(\eta_{\text{LS}}) Q = \frac{1}{5} \mathcal{R} Q(\eta_0, \theta, \phi) \equiv \sum_{l=2}^{\infty} \sum_{m=-l}^l a_{lm} Y_{lm}(\theta, \phi),$$

$$\Phi = \frac{3}{5} \mathcal{R}$$

JGB notes

$$C_l^{(S)} = \frac{4\pi}{25} \int_0^\infty \frac{dk}{k} \mathcal{P}_{\mathcal{R}}(k) j_l^2(k\eta_0)$$

$$C_l^{(S)} = \frac{2\pi}{25} A_S^2 \frac{\Gamma[\frac{3}{2}] \Gamma[1 - \frac{n-1}{2}] \Gamma[l + \frac{n-1}{2}]}{\Gamma[\frac{3}{2} - \frac{n-1}{2}] \Gamma[l + 2 - \frac{n-1}{2}]},$$

$$\frac{l(l+1) C_l^{(S)}}{2\pi} = \frac{A_S^2}{25} = \text{constant}, \quad \text{for } n = 1$$

Derivation of Sachs-Wolfe effect

4) Similarly for tensors. They obey the following ODE:

$$h_k'' + 3\mathcal{H} h_k' + (k^2 + 2K) h_k = 0$$

JGB notes

5) The contribution in the spectrum is

$$\frac{\delta T}{T}(\theta, \phi) = \int_{\eta_{\text{LS}}}^{\eta_0} dr h'(\eta_0 - r) Q_{rr}(r, \theta, \phi)$$

$$Q_{kl}^{rr}(r) = \left[\frac{(l-1)l(l+1)(l+2)}{\pi k^2} \right]^{1/2} \frac{j_l(kr)}{r^2}$$

SW_cls.nb

6) A similar calculation gives:

$$C_l^{(T)} = \frac{9\pi}{4} (l-1)l(l+1)(l+2) \int_0^\infty \frac{dk}{k} \mathcal{P}_g(k) I_{kl}^2,$$

$$I_{kl} = \int_0^{x_0} dx \frac{j_2(x_0 - x) j_l(x)}{(x_0 - x)x^2},$$

$$l(l+1) C_l^{(T)} = \frac{\pi}{36} \left(1 + \frac{48\pi^2}{385} \right) A_T^2 B_l,$$

$$B_l = (1.1184, 0.8789, \dots, 1.00) \text{ for } l = 2, 3, \dots, 30.$$

The Integrated Sachs-Wolfe effect

1) ISW effect → photon escapes time-varying potential due to accelerated expansion caused by DE → late time effect at large scales ($l < 20$)!

Dodelson 8.5.1

$$\frac{\Delta T}{T} \simeq \int_0^{\eta_0} (\dot{\phi} + \dot{\psi}) d\eta \quad \longrightarrow \quad \Delta_\ell \simeq \int_0^{\eta_0} e^{-\tau} (\dot{\phi} + \dot{\psi}) j_\ell [k(\eta_0 - \eta)] d\eta$$

$$\tau = \int_{\eta_{rec}}^{\eta_0} d\eta n_e \sigma_\tau a(\eta)$$

Optical depth, see later

2) The Cls depend strongly on DE!

$$C_\ell^{ISW} = 4\pi \int \frac{dk}{k} I_\ell^{ISW}(k)^2 \frac{9}{25} \frac{k^3 P_\zeta}{2\pi^2} \quad \longrightarrow \quad \frac{k^3 P_\zeta}{2\pi^2} = A_s \left(\frac{k}{k_0}\right)^{n_s-1} T(k)^2$$

Transfer function, see Eq (7.71) in Dodelson

$$I_\ell^{ISW}(k) = 2 \int dz \frac{dG}{dz} j_\ell(k r(z))$$

$$G(a, k) = \frac{\Phi(a, k) + \Psi(a, k)}{\Phi(a_{ini}, k) + \Psi(a_{ini}, k)}$$

Other effects

1) Diffusion damping= Damping at small scales (large l) due to increase in mean free path of photons

$$\ddot{S} + \frac{\dot{R}}{1+R}\dot{S} + k^2 c_s^2 S = \left(-\frac{k^2}{3}\psi - \frac{k^2}{3}\phi/(1+R) \right)$$

Damping term

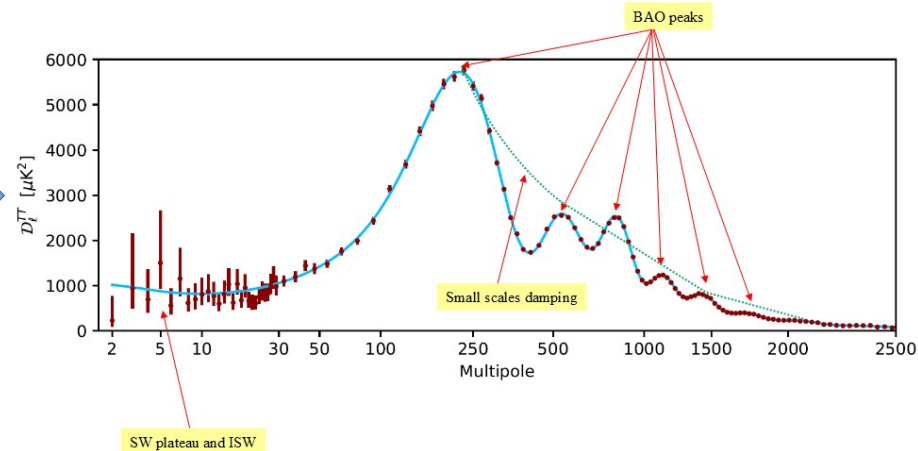

Oscillatory term

“Driving force”

2) Damping term gives rise to exponential suppression in Cls (Dodelson 8.4/pg 230)

$$\delta_\gamma \simeq \cos(kr_s(\tau)) e^{-\frac{k^2}{k_D^2}}$$

$$k_D^{-2} \equiv \int_0^\tau \frac{d\eta'}{6(1+R)n_e\sigma_T a(\eta')} \left[\frac{R^2}{1+R} + \frac{8}{9} \right]$$

Other effects

3) Adiabatic/isocurvature perturbations. Consider volume with equal distribution of matter and radiation. Two ways to perturb:

i) Change volume adiabatically (conserve entropy) → number density the same

$$\delta_\gamma = \frac{\delta\rho_\gamma}{\rho_\gamma} = \frac{\delta n_\gamma}{n_\gamma} \xrightarrow{n_\gamma \sim T^3} \frac{\delta T}{T} = \delta_\gamma/3 \longrightarrow \delta_\gamma = 3\frac{\delta T}{T}$$

ii) Perturb entropy, keep energy density the same $\rho_m \delta_m = \rho_\gamma \delta_\gamma$:

$$\delta_\gamma = 3\frac{\delta T}{T} + \text{const.}$$

4) Doppler shift (dipole):

i) Plasma had non-zero velocity at recombination

ii) Milky Way moves at 600km/h wrt CMB

$$\frac{\delta T}{T}(\mathbf{r}) = -\frac{\mathbf{r} \cdot \mathbf{v}}{c}$$

Other effects

5) Reionization at $z \sim 10$:

From quasar spectra we know Universe reionized at $z \sim [6, 20] \rightarrow$ more scattering with electrons (Thomson scattering). This affects modes within the horizon at the time of re-ionization or $l \gg 1$ (small scales) by reducing the Cls:

$$\Delta_l \rightarrow \Delta_l e^{-\tau}$$

$$\tau = \int_{\eta_{rec}}^{\eta_0} d\eta n_e \sigma_T a(\eta)$$

6) Cosmic Variance:

For each l we have $2l+1$ a_{lm} coefficients, of which we can only predict the distribution not actual values, ie they are random variables

$l=100 \rightarrow 201$ a_{lm} (good for statistics!)

$$a_{lm} = (-i)^l 4\pi \int d^3k Y_{lm}^*(\hat{k}) \Delta_l(\vec{k}, \tau)$$

$l=2 \rightarrow 5$ a_{lm} (not good for statistics!)

$$\langle a_{lm} a_{l'm'}^* \rangle = C_l \delta_{ll'} \delta_{mm'}$$

Cosmological parameters

1) Curvature changes distances:

$$d_A = \frac{1}{1+z} \frac{c}{H_0 \sqrt{\Omega_K^{(0)}}} \sinh \left(\sqrt{\Omega_K^{(0)}} \int_0^z \frac{dz}{E(\tilde{z})} \right)$$

Main effect is on the location of the 1st peak ~distance to recombination

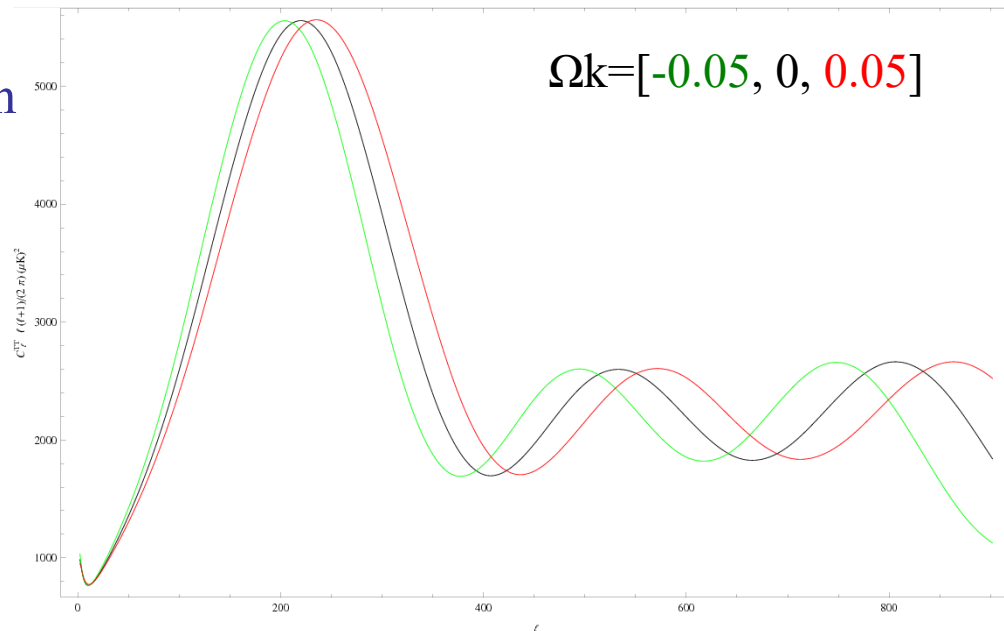

$$k_p = \frac{n\pi}{r_s}$$

$$\ell_A \equiv \pi D / s_*$$

$$\ell_m = \ell_A (m - \phi)$$

$$\phi \approx 0.267 \left(\frac{r_*}{0.3} \right)^{0.1}$$

Cosmological parameters

2) Spectral index n_s affects normalization

$$C_l = 4\pi \int d^3k P_\psi(k) \Delta_l^2(k, \tau) \quad \longrightarrow \quad \frac{C_\ell(n_s)}{C_\ell(n_s = 1)} \simeq \left(\frac{\ell}{\ell_0}\right)^{n_s - 1}$$

$P_\psi \sim k^{n_s - 1}$

3) Dark energy \rightarrow late time effect ($z < 1$) at large scales ($l < 10$) \rightarrow ISW effect

$$C_\ell^{\text{ISW}} = 4\pi \int \frac{dk}{k} I_\ell^{\text{ISW}}(k)^2 \frac{9}{25} \frac{k^3 P_\zeta}{2\pi^2}$$

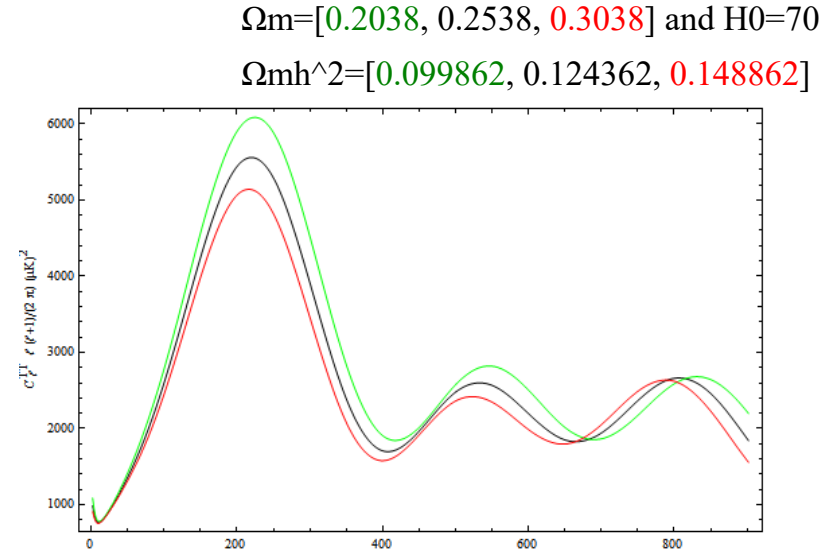

$$I_\ell^{\text{ISW}}(k) = 2 \int dz \frac{dG}{dz} j_\ell(k r(z))$$

Cosmological parameters

4) Ω_m affects DM potentials
(deeper potentials \rightarrow less BAO)

$$\psi = -4\pi G_N \frac{a^2}{k^2} \rho_m \delta_m$$

5) Ω_b affects height of peaks

$$\ddot{S} + \frac{\dot{R}}{1+R} \dot{S} + k^2 c_s^2 S = \left(-\frac{k^2}{3} \psi - \frac{k^2}{3} \phi / (1+R) \right)$$

$$R = \frac{3 \Omega_b}{4 \Omega_\gamma} = \frac{a^{-3}}{a^{-4}} R_0 = R_0 a$$

Behaviour of the power spectrum $P(k)$

1) Matter power spectrum is an important quantity, affecting the CMB

$$P(k) \equiv \langle |\delta_k|^2 \rangle$$

2) The potential can be written as

$$\Phi(k, a) = \Phi_p(k) \times T(k) \times \delta(a)$$

Initial value from inflation

$$\langle \Phi_p^2 \rangle \sim k^{-3} k^{n_s - 1}$$

Transfer function

$$T(k) = \frac{\Phi(k, a_{\text{late}})}{\Phi_{\text{large}}(k, a_{\text{late}})}$$

$$k_{eq} = 0.073 \Omega_{m0} h \text{ (h/Mpc)}$$

3) With these, express $P(k)$ as

$$\begin{aligned} P(k) &= \langle \delta_k^2 \rangle \\ &= k^4 \langle \Phi_p^2 \rangle T(k)^2 \delta(a)^2 \\ &\sim k^4 k^{-3} k^{n_s - 1} T(k)^2 \\ &\sim k^{n_s} T(k)^2 \end{aligned}$$

$$k \gg k_{eq} \rightarrow \delta \sim const \rightarrow \Phi \sim 1/k^2 \rightarrow T \sim 1/k^2 \rightarrow P(k) \sim k^{-3}$$

$$k \ll k_{eq} \rightarrow \Phi \sim const \rightarrow \delta \sim k^2 \rightarrow T \sim 1 \rightarrow P(k) \sim k$$

Behaviour of the power spectrum $P(k)$

4) Behavior of transfer function

$$T(k) = \begin{cases} 1/k^2, & k \gg k_{eq} \\ 1, & k \ll k_{eq} \end{cases}$$

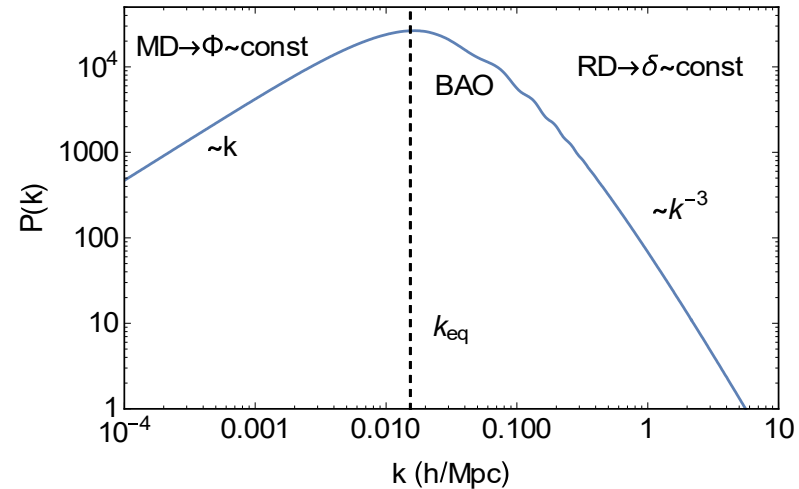

5) Behavior of $P(k)$

$$P(k) = \begin{cases} 1/k^3, & k \gg k_{eq} \\ k, & k \ll k_{eq} \end{cases}$$

6) Fourier transform of $P(k)$ is $\xi(r)$,
the correlation function (\sim prob of galaxies at r)

$$\xi(r) = \frac{1}{2\pi^2} \int_0^\infty P(k) j_0(kr) k^2 dk$$

$$\xi(r) = r^{-n-3}, \quad n = (1, -3)$$

$$k_{eq} = 0.073 \Omega_{m0} h \text{ (h/Mpc)}$$

Discussion of Planck papers

See Planck papers for more details!

Boltzmann codes

Calculating all the previous stuff is tedious!

There are a few codes though (CAMB, CLASS etc)

Code for Anisotropies in the Microwave Background

by [Antony Lewis](#) and [Anthony Challinor](#)

Pros: Code in f90, fast, recently updated, forum support.

Cons: Code in f90, not very modular...

Code in C++, recently updated, very modular

Documentation a bit confusing sometimes

For now we focus in CLASS

Quick tour of CLASS

Compile/run CLASS (Reqs: make, gcc)

The various files (.c, .ini etc)

**The equations are in both synchronous & conformal
Newtonian gauge (see Advanced Cosmo next semester).**

Quick tour of CLASS

1) Get CLASS from :

https://lesgourg.github.io/class_public/class.html

https://github.com/lesgourg/class_public

2) Unzip with a tool (WinZip, 7 Zip etc) or on Macs, Linux:

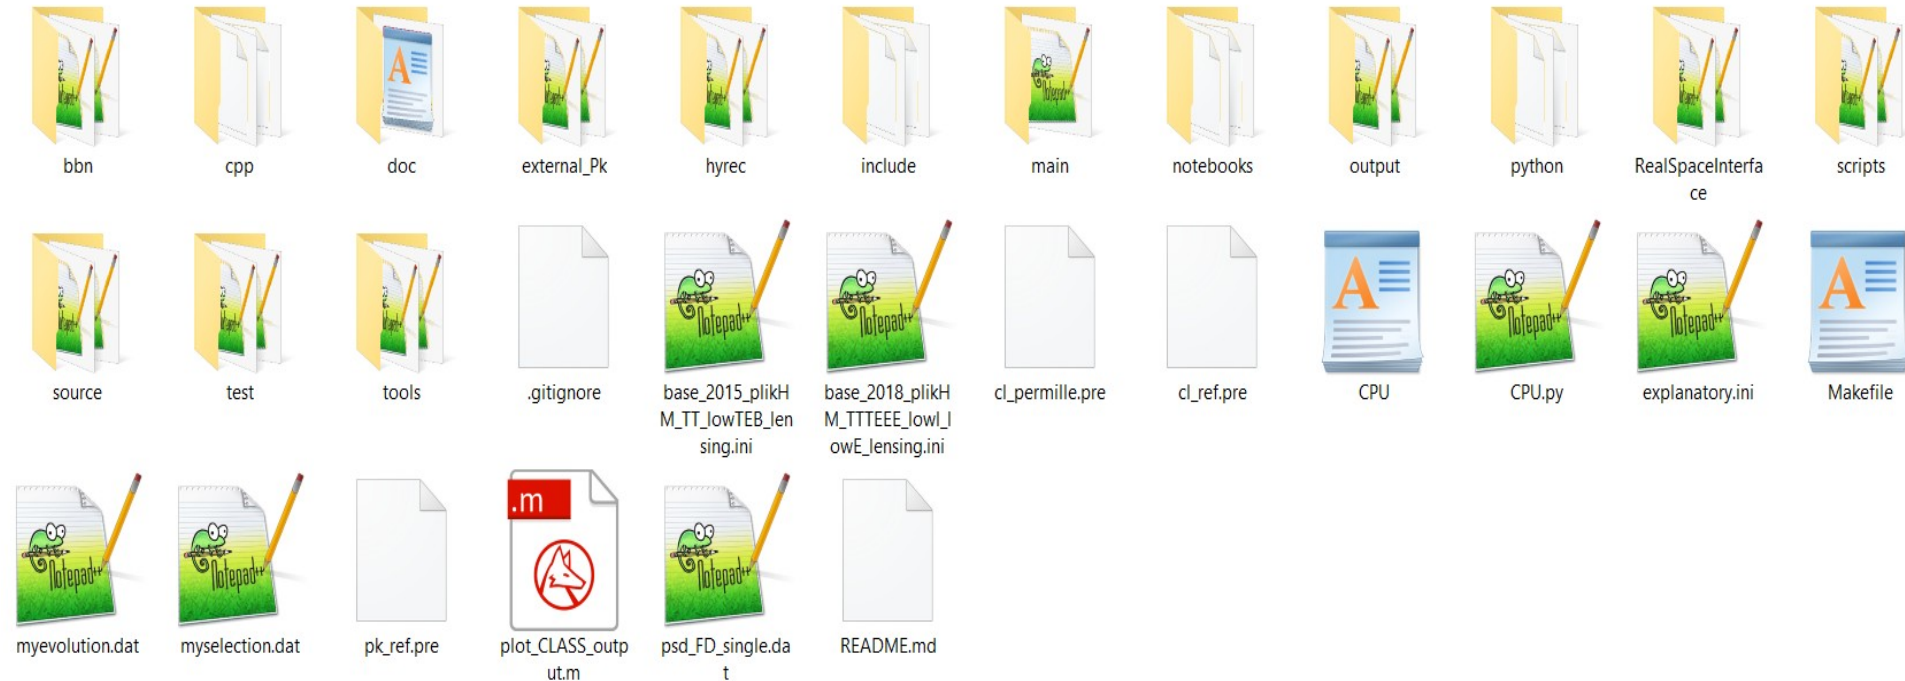

`tar xfv CLASS.tar.gz`

3) Navigate to the CLASS directory and have a look at the files

i) `cd CLASS`

ii) on Windows just navigate to the folder!

Quick tour of CLASS

\source: Folder with c files that numerically solve CMB equations

explanatory.ini: File with cosmological parameters

\doc: Folder with manual you ****SHOULD**** read!!! **DISCUSS**

***.pre:** Files with higher-precision settings

\bbn, \main, \tools, \hyrec, \python: Folders with Utilities

\output: output files are saved, **python**

Makefile: Main compiler options

Quick tour of CLASS

background.c: Solves background aka Friedmann equations.

input.c: Reads the parameters from the ini files.

lensing.c: Applies CMB lensing to spectra.

nonlinear.c: Applies non-linear corrections to $P(k)$ at $k > 0.1 \text{ h/Mpc}$.

output.c: Writes the final spectra to txt files.

perturbations.c: Solves perturbation equations!!!

primordial.c: Contains the primordial power spectrum $P(k)$ from inflation.

spectra.c : Calculates the spectra Cls.

thermodynamics.c: Does the recombination stuff etc.

transfer.c: Calculates transfer functions $T(k)$.

Quick tour of CLASS

Run: make class

```

/cygdrive/c/Users/Savvas/Desktop/class_public-2.9.0
Savvas@LAPTOP-C1VKME8A /cygdrive/c/Users/Savvas/Desktop/class_public-2.9.0

The Cls and the correlation function

Result is txt files with the Cls...

$$T(\vec{x}, \hat{p}, \eta) = T(\eta) [1 + \Theta(\vec{x}, \hat{p}, \eta)]$$

$$\Theta(\vec{x}, \hat{p}, \eta) = \sum_{l=1}^{\infty} \sum_{m=-l}^l a_{lm}(\vec{x}, \eta) Y_{lm}(\hat{p})$$

$$\langle a_{lm} \rangle = 0 \quad ; \quad \langle a_{lm} a_{l'm'}^* \rangle = \delta_{ll'} \delta_{mm'} C_l$$

... and the matter power spectrum $P(k)$

$$\delta(\vec{x}) \equiv \frac{\rho(\vec{x}) - \langle \rho \rangle}{\langle \rho \rangle} \quad P(k) \equiv \langle |\delta_k|^2 \rangle$$

$$\xi(\vec{r}) \equiv \langle \delta(\vec{x}) \delta(\vec{x} + \vec{r}) \rangle$$

$$\xi(r) = \frac{1}{(2\pi)^3} \int P(k) \frac{\sin(kr)}{kr} 4\pi k^2 dk$$

Correlation function:

Denotes probability to find galaxy at position r

The variables and the equations

1) Friedman equations in GR (dot is conformal time)

For more details see
Advanced Cosmo
class next semester!

$$\begin{aligned}\left(\frac{\dot{a}}{a}\right)^2 &= \frac{8\pi}{3}Ga^2\bar{\rho} - \kappa, \\ \frac{d}{d\tau}\left(\frac{\dot{a}}{a}\right) &= -\frac{4\pi}{3}Ga^2(\bar{\rho} + 3\bar{P}),\end{aligned}$$

2) More than one ways to perturb the FRW metric!

i) Conformal Newtonian gauge:

$$ds^2 = a^2(\tau) \left\{ -(1 + 2\psi)d\tau^2 + (1 - 2\phi)dx^i dx^j \right\}$$

ii) Synchronous gauge:

$$ds^2 = a^2(\tau) \left\{ -d\tau^2 + (\delta_{ij} + h_{ij})dx^i dx^j \right\}$$

CLASS implements both synchronous and conformal gauges $\sqrt{-g}(\tau)$

The variables and the equations

3) The perturbation equations in Conformal Newtonian gauge

For more details see
Advanced Cosmo
class next semester!

$$k^2\phi + 3\frac{\dot{a}}{a}\left(\dot{\phi} + \frac{\dot{a}}{a}\psi\right) = 4\pi Ga^2\delta T^0_0(\text{Con}),$$

$$k^2\left(\dot{\phi} + \frac{\dot{a}}{a}\psi\right) = 4\pi Ga^2(\bar{\rho} + \bar{P})\theta(\text{Con}),$$

$$\ddot{\phi} + \frac{\dot{a}}{a}(\dot{\psi} + 2\dot{\phi}) + \left(2\frac{\ddot{a}}{a} - \frac{\dot{a}^2}{a^2}\right)\psi + \frac{k^2}{3}(\phi - \psi) = \frac{4\pi}{3}Ga^2\delta T^i_i(\text{Con}),$$

$$k^2(\phi - \psi) = 12\pi Ga^2(\bar{\rho} + \bar{P})\sigma(\text{Con}),$$

4) The perturbation equations in Synchronous gauge

$$k^2\eta - \frac{1}{2}\frac{\dot{a}}{a}\dot{h} = 4\pi Ga^2\delta T^0_0(\text{Syn}),$$

$$k^2\dot{\eta} = 4\pi Ga^2(\bar{\rho} + \bar{P})\theta(\text{Syn}),$$

$$\ddot{h} + 2\frac{\dot{a}}{a}\dot{h} - 2k^2\eta = -8\pi Ga^2\delta T^i_i(\text{Syn}),$$

$$\ddot{h} + 6\ddot{\eta} + 2\frac{\dot{a}}{a}(\dot{h} + 6\dot{\eta}) - 2k^2\eta = -24\pi Ga^2(\bar{\rho} + \bar{P})\sigma(\text{Syn}).$$

The potentials

For more details see
Advanced Cosmo
class next semester!

$$k^2(\phi - \psi) = 12\pi G a^2 (\bar{\rho} + \bar{P}) \sigma(\text{Con}),$$

```
6273 /* equation for psi */
6274 ppw->pvecmetric[ppw->index_mt_psi] = y[ppw->pv->index_pt_phi] - 4.5 * (a2/k2) * ppw->rho_plus_p_shear;
6275
6276 /* equation for phi' */
6277 ppw->pvecmetric[ppw->index_mt_phi_prime] = -a_prime_over_a * ppw->pvecmetric[ppw->index_mt_psi] + 1.5 * (a2/k2)
* ppw->rho_plus_p_theta;
```

$$k^2 \left(\dot{\phi} + \frac{\dot{a}}{a} \psi \right) = 4\pi G a^2 (\bar{\rho} + \bar{P}) \theta(\text{Con}),$$

Etc for the rest...

Basic code flowchart

1) User inputs main cosmological parameter Ω_m , Ω_b , n_s , H_0 etc

2) Calculate background evolution $H(z)$ and $a(t)$...

3) Wait for code to solve perturbation equations of Boltzmann hierarchy and multipoles $\Delta_l(k)$ for grid of values of k , usually in $k \rightarrow [0.0001, 10]h/\text{Mpc}$

4) Calculate matter power spectrum $P(k) \equiv \langle |\delta_k|^2 \rangle$ and $C_l = 4\pi \int d^3k P_\psi(k) \Delta_l^2(k, \tau)$
Also include other secondary effects as discussed earlier.

5) Output results or feed to MCMC code to estimate best-fit parameters!

Summary

- 1) CMB revolutionized modern cosmology, helped transition to precision science
- 2) Main features of CMB: primary and secondary anisotropies
- 3) BAO is the main feature of CMB and contains most of information.
- 4) Planck papers are the pinnacle of several years worth of hard work. Contain all info on experiment and results of analysis.
- 5) Boltzmann codes (CAMB, CLASS) do the heavy lifting of calculating the spectra.
- 6) Outlook: Tons of things to do with CMB: tensors and BB spectra, more accurate polarization, spectral distortions etc.
